
WHAT

Transdisciplinary education is all about collaboration—specifically collaboration between students, teachers, researchers, and societal partners from outside the educational sphere. They work together to learn, create, and research.

Transdisciplinary collaboration, as a second characteristic, revolves around an issue that can be approached from many perspectives. These issues are societal or sustainability problems for which no simple solutions exist.

A key third feature of transdisciplinary work is that all partners are equal in the collaboration. The differences between team members lead to original ideas and mutual learning. As often said, "There are no transdisciplinary experts, only practitioners."

This way of working brings challenges, especially in education. The TRAIL provides guidelines and insights to help you tackle these challenges.
