
WHY

Our society is changing rapidly, and not always for the better. Many of these changes stem from so-called 'wicked problems'—complex issues with no clear solutions. To address these challenges and ultimately create a sustainable future, different disciplines and societal actors must collaborate.

In a world with such challenges, higher education is not just about getting a job—it's your ticket to acquiring skills for a better and unpredictable future: think leadership, innovation, and problem-solving abilities.

Participating in transdisciplinary education gives you the chance to develop new perspectives and insights on existing challenges. It also prepares current and future professionals for a constantly changing world.

What makes transdisciplinary education even more interesting is that you are not learning alone. The goal is to learn together with your teachers and societal partners—personal development is, after all, a lifelong process. This means that they—teachers and partners—will also learn from you. You have a voice in this process, so use it and dare to speak up.
