
WHY

Empowering Teachers: navigating towards the future of education

In a dynamic and ever changing society, higher education plays a crucial role: institutions must equip students with the skills and competencies essential for their own future and that of society.

As a teacher, you bear a great responsibility. Traditional teaching methods fall short in enhancing knowledge development, critical thinking, and long-term motivation. Moreover, the expansion of classroom education challenges meaningful teacher-student relationships. It can hinder the development of both less engaged and talented students.

As we face these challenges, the call for broader perspectives on education grows. Transdisciplinary working methods offer promising answers. It provides you, as a teacher, with a platform to reconnect with students and develop essential, broad skills.

With transdisciplinary co-creation - involving researchers, policymakers, entrepreneurs, and citizens - you can also work directly on complex issues and make societal impacts.

**Explore these issues and rewrite the future of education. Step by step,
innovation by innovation.**
