
What

In the TRAIL, we define transdisciplinarity as "the collaboration of academic researchers from various disciplines with non-academic partners to jointly create new knowledge and theories for a common goal" (OECD, 2021). This definition highlights three characteristics: 1) non-academic participants collaborate with students, teachers, and researchers; 2) the collaboration is based on equality among all team members; 3) and the focus revolves around a complex societal issue.

Transdisciplinary education thus means integrating the knowledge and experience of researchers, teachers, and students from different disciplines with non-academic participants: you, the societal partner. Together, you co-create new knowledge or products to achieve a common goal.
