
Introduction

There are various ways for external parties to participate in transdisciplinary education. Often, the initiative comes from an educational institution that develops a project and involves relevant external partners. Sometimes, a complex question from a company or organization will come to the attention of the educational institution. You might already have such a question in mind.

Theory

Collaboration depends on the network of the initiator. Research shows that external partners are often recruited from the knowledge circle of teachers, researchers, or students (Vinckx, van Loon & Vleuten, 2022). Sometimes, collaborations are geographically connected, as with the Urban Living Lab Breda in the south of the Netherlands.

Another method is an open call, such as the Academic Consultancy Training (ACT) - WUR of Wageningen University (NL). Companies and societal organizations can also establish sustainable collaborations with existing transdisciplinary educational settings.

Practice

During the TRAIL, you will learn more about the different phases of transdisciplinary education: setting up the team, developing the project, participating in the project, and finally evaluating it.
