
What is your role as a partner outside the education and research domain?

In transdisciplinary education, your role makes the difference because you represent the world outside the walls of the academies. The idea of transdisciplinary education is to bring education and science closer to society. In collaboration with multiple partners, solutions can be found for complex problems.

The Quintuple Helix Model describes and illustrates how interaction and integration between academia, industry, government, society, and the natural environment are necessary to contribute to innovations and knowledge production for complex societal issues (Carayannis et al., 2012).
