
Introduction

After designing a framework for the program, it is important to find a way to implement the program within the institution.

Research conducted at Avans University of Applied Sciences (*Kurris, van Tuijl, Waldram & Wolfensberger, under review*) compiles the experiences of pioneers in the Netherlands who have initiated and implemented transdisciplinary education.

More information about this research and the researchers can also be found on this page.

On the **theory** page, you'll find a brief summary of the entire study, including the key recommendations.

Soon, under the **practice tab**, you'll find a tool that will help you effectively tackle implementation challenges.

Theory

Transdisciplinary education is still a new phenomenon for many, but in recent years, numerous educational pioneers around the world have begun experimenting and developing transdisciplinary projects.

Research from the professorship *Transdisciplinary Collaboration in Education* has gathered insights and experiences from such pioneers at universities of applied sciences and research universities across the Netherlands. Together, this offers a practical glimpse into the reality of developing and implementing transdisciplinary education.

Below you'll find the main outcomes, presented as recommendations for implementation at:

- the **micro level** (on the ground, in the classroom),
- the **meso level** (within the institution),
- and the **macro level** (the education system).

An article covering the full research – including information about the methodology, all results, and the discussion – will be available here soon. Find more information about the article [Helpende en belemmerende factoren in het opzetten en uitvoeren van transdisciplinair onderwijs | Avans Hogeschool](#)

Practice

A practical tool will soon be available here, based on an extensive study into the development and implementation of transdisciplinary education.
