
Introduction

Although there is no guarantee of a predefined result, transdisciplinary collaboration can lead to a wide range of project outcomes because it is driven by learning. It may result in innovative solutions to local challenges such as water usage, a pitch or proposal to local officials, a conference for local stakeholders, a game, a film, a comic, a podcast, a website, etc. These are all **tangible outcomes** of the project that can be assessed based on their direct impact.

The theory page discusses various types of tangible outcomes, and the practice page presents some examples.

Theory

Based on learning objectives and the concept of *innovation workspaces* (Cremers et al., 2016), there are several possible tangible outcomes, such as knowledge acquisition or action-oriented results.

Knowledge / Products

One possible outcome is the acquisition of knowledge in the form of concepts, tools, or models to help others address the complex problem being tackled. Additionally, design products can be created in the form of prototypes.

Action-Oriented Outcomes

Another type of outcome can be action-oriented. This means an intervention may take place in a specific location. This could be a workshop, a meeting, a training session, a gathering, or a change in the environment. Participants must roll up their sleeves and work

toward transformation in the context they're operating in.

An example of such an action-oriented outcome is a workshop in the *Act for Change* minor at Avans University of Applied Sciences. As part of this program, students collaborated with refugees to help them connect through sports activities. It may start as a small gesture that grows into something bigger. In this way, a transdisciplinary project creates fertile ground for societal growth.
