
Visible outcomes: knowledge acquisition and action-oriented results

Discover various forms of visible outcomes in this text. From innovative solutions and workshops to films and podcasts—tangible results can lead to immediate impact and create fertile ground for societal transformation. So: be ready to roll up your sleeves!

Transdisciplinary collaboration can result into a wide range of visible project outcomes: from innovative solutions for local challenges and a pitch to local officials, to a conference for stakeholders, a game, film, comic, podcast, or website. These are all tangible outcomes of the project that can be evaluated based on their direct impact.

These tangible outcomes can be categorized into *knowledge products* and *action-oriented results* (Cremers et al., 2016).

Knowledge products

One possible outcome focuses on knowledge acquisition. Think of concepts, tools, or models to support others in tackling a wicked problem. Additionally, design products in the form of a prototype can be created.

Action-oriented results

Another type of outcome is action-oriented. This means organizing an intervention in a particular place. For example, a workshop, training, or gathering, but also something as concrete as a change to the spatial environment. To actually implement a transformation in the environment where you work, you must be willing to get hands-on as a team member. Often, this starts with a small gesture that grows into something larger. In this way, a transdisciplinary project creates fertile ground for societal growth.
