
Introduction

You've reached the top—the final result of the project. Now it's time to return to the valley. During this return, it's important to **evaluate together**.

Evaluation is a process in which you systematically collect, analyze, and interpret information together to assess the **value, effectiveness, or quality** of something (Scriven, 1967).

Evaluation helps you identify the strengths and weaknesses of your transdisciplinary education journey and propose improvements. It also supports accountability for what you've done and achieved together, strengthening the trust of your stakeholders. Moreover, a good evaluation provides insight into areas where participants can still grow and develop.

How to start this evaluation process? On the **practice page**, you'll find information about the **PDCA cycle**—a classic, practical evaluation tool.

Theory

There are many ways to shape the evaluation

process. That's why it's important to discuss it early and develop an **evaluation plan**. This plan outlines what you'll evaluate, with which tools, when and how often, and how you'll communicate and act on the improvement points.

Setting up the plan using the **Plan, Do, Check, Act (PDCA)** cycle is helpful—a

tool developed in the mid-20th century by **Edwards Deming** (Moen & Norman,

2006). This is an **iterative process model** that helps implement improvements based on evaluations:

- **Plan:** Develop the evaluation plan
- **Do:** Execute the plan
- **Check:** what improvements are needed based on the data
- **Act:** Implement the improvements
