
Introduction

Transdisciplinary collaboration requires both existing and new roles, which may shift during the process. Examples of roles include:

- Initiator
- Coordinator
- Networker
- Knowledge connector
- Process facilitator
- Expert
- Doer
- Bridge-builder

Theory

The [Participatiematrix](#) is a tool for discussing each person's desired role in a (research) project. It was originally developed for collaboration with patients (experts by experience), but it can be applied more broadly — including in your project.

Here are a few final practical tips to help you get to know each other and each other's roles better:

-
- **Role playing** operates (Vogelbein & Spohrer, 2024) by do
 - **Metacognitive** knowledge about learning, getting links, for a different way.
 - **Situational playing game** Step into a specific role and view

(See, for example, the workshop by Kurrus et al., 2023 — [link to follow](#).)

Practice

*Transdisciplinary work is a process, and so is gathering and collecting knowledge about it. More information will follow soon. **Sign up for the TRAIL newsletter** to stay informed about content updates!*
