
Introduction

To create a strong collaboration culture, there are several general conditions that help support the process. Since transdisciplinary work differs in complexity and expectations from the types of collaboration most people are familiar with, it's important to become acquainted with it beforehand.

On the **Theory** page, five conditions are discussed that support a culture in which transdisciplinary collaboration can thrive.

Under the **Practice** tab, you'll find the **Partnership Map**: a tool for building relationships in (complex) collaborations.

Theory

The *Practical Guide to Transdisciplinary Collaboration* (Het Groene Brein, 2023) defines **five pillars for successful collaboration**:

1. **Equality** Recognizing that knowledge comes from many different sources and that everyone has something to contribute to tackle complex problems.
2. **Relationality** Building relationships and experience over time, rather than just focusing on the immediate problem-solving as a one-off.
3. **Transparency** Being open and honest in communication among team members.
4. **Flexibility** Being open to changing plans and adapting to new information.
5. **Diversity** Having a mix of backgrounds, experiences, and assumptions.

Practice

The partnerschapskaart is a dialogical tool that helps build partnership relationships in transdisciplinary (i.e., mixed) groups. The method consists of five steps, where the map is filled out from right to left in a mixed group of stakeholders/partners involved in a project or program.
